## WHAT IS CLAIMED IS:

- 1. A process for producing a multipurpose, multi-functional apple base which comprises:
- 5 (a) washing and sanitizing apples to inactivate residual microorganisms therein;
  - (b) cutting the apples into suitable sized pieces;
  - (c) steaming the apple pieces to inactivate enzymes, to gelatinize the protoplasts, to break down the intercellular protopectin and to inactivate microorganisms;
  - (d) mascerating and screening the steamed apple pieces to produce a mince and to eliminate unwanted skin and core components;
  - (e) comminuting the apple mince to form a mash with predominantly intact single cells;
  - (f) homogenizing a portion of the mash to fracture the intact, single cells for the production of protoplasmic microparticles, solubilized pectin and size-specific cell wall fragments; and
    - (g) adding 5 to 80% weight mash to the fractured cell homogenate of step (f) to produce the multipurpose, multi-functional apple base.

2. A process as claimed in claim 1 wherein the washed and sanitized apple pieces are steamed at a temperature between 100 and 110°C to gelatinize the protoplasts, to inactivate the enzymes and to solubilize the protopectin in the middle lamellae to water-dispersible pectin.

3. A process as claimed in claim 1 wherein the steamed apple pieces are subjected to impaction in a finisher/pulper to produce an apple mince with cellular aggregates and without core, seed and skin components which are removed as waste.

- 4. A process as claimed in claim 1 wherein the apple mince is passed through a comminutor with specific screens to produce an apple mash with a predominance of intact single cells by disjoining the aggregated cells upon mechanical impaction,
- 35 5. A process as claimed in claim 1 wherein the apple mash is subject to homogenization at a pressure between 1000 and 5000 psig to bring about the

30.

fracture of the intact, single cells to produce a slurry with protoplasmic microparticles, size-specific cell wall fragments and solubilized pectin.

- 6. A process as claimed in claim 1 wherein a measured amount of apple mash
  5 (5 to 80% weight) is added to the homogenized slurry to produce creaminess, viscosity increase, opacity and apple stability.
  - 7. A process as claimed in claim 1 wherein gum stabilizers are added to increase the viscosity of the apple base to enhance the stability.

- 8. A process as claimed in claim 1 wherein stabilizers selected from the group consisting of pectin and guar gum are added to the mash.
- 9. A process as claimed in claim 1 wherein ascorbic acid is added to the apple
   15 base to increase the vitamin C content and to keep polyphenolic compounds in a reduced state.
  - 10. A process as claimed in claim 1 wherein 15 to 50% weight mash is added to the fractured cell homogenate of step (f).
  - 11. A process as claimed in claim 3 wherein the finisher/pulper has a screen opening of 0.05 to 0.13 inches (1.5 to 3.35 mm).
- 12. A process as claimed in claim 4 wherein the comminutor has screen openings between 0.033 and 0.093 inches (0.85 and 2.36 mm).
  - 13. A process as claimed in claim 5 wherein the homogenization pressure is between 2000 and 3500 psig.
